BetaRevive | GlucoFlow

Health-a-thon 2026

About the Team / Organisation

BetaRevive is building GlucoFlow, an assistive inpatient coordination prototype. The implementation combines a web workspace, bounded agent tools and a source-linked operational audit trail.

Problem Statement (use case specific)

During inpatient DKA care, staff reconcile laboratory handoffs and carry unresolved work across shifts. A collection entry does not establish lab receipt. A validated result does not establish clinician acknowledgement.

Initial users are doctors, nurses and laboratory staff. The supplied workflow notes identify recording discrepancies and communication gaps. Their frequency and clinical impact remain unmeasured.

AI Solution Description

Staff ask about pending work. GlucoFlow retrieves the encounter and source events, proposes a bounded operational task, and prepares a handover for human review.

Technology and Tools Used

React/TypeScript, Fastify, PostgreSQL/Supabase, native Hermes, OpenUI and Sarvam speech. Web on Vercel; API/runtime on Azure. Hospital and lab feeds are simulated.

Key Features of the Solution

Source-linked chat and encounter views
Human-approved tasks with evidence-based completion
Reviewed handovers and audit history
Versioned procedures with sandbox checks
Editable voice input and explicit read-aloud

Build Sprint Progress

The initial record-review workflow evolved into inpatient coordination. The build adds Hermes, task monitoring, source inspection, reviewed procedures and a shared chat workspace. Recent feedback removed duplicated navigation and added New chat.

User Validation and AI Evaluation

7 Nov: 282 application tests passed in the navigation release. The latest focused care run passed 15/15 tests. Hosted checks confirmed new-chat creation, encounter persistence and a 390 px mobile layout.

Developer and team feedback informed UI changes. No clinician pilot, clinical accuracy claim or measured workload reduction is reported. Full browser, device and latency verification remain open.

Safety and Responsible AI

Fictional data only. No diagnosis, prescribing or clinical decision support. Server authorization, source evidence and human approval constrain actions.

Deployment and Sustainability Plan

Proposed 60–90 day shadow pilot in one ward. Start with agreed event imports, named owners and approved local targets. Measure collection-to-receipt lag and missing receipts. A facility subscription remains a business hypothesis.
